Test Instructions

General Rules

- The test contains three reading passages and 40 questions.
- Allow approximately 20 minutes for each passage.
- Read every instruction carefully before answering.
- Write answers in the spaces provided.
- Check spelling and word limits for completion tasks.
- Transfer and review all answers before the time ends.

Time Plan

01

Passage 1

Questions 1–13 — 20 minutes

02

Passage 2

Questions 14–26 — 20 minutes

03

Passage 3

Questions 27–40 — 20 minutes

Do not turn over until you are told to begin. Manage your time carefully — 20 minutes per passage is recommended.

You should spend about 20 minutes on Questions 1–13, which are based on Reading Passage 1 below.

Do animals dream?

Studies using electrodes attached to the heads of sleepers have shown that when we sleep, we do so in two ways that alternate throughout the night. The first is rapid eye movement (REM) or active sleep. During this stage our eyes move, even though our eyelids are closed. Our muscles also twitch slightly, though they are largely paralysed so we don't hurt ourselves. In contrast, we also engage in non-REM sleep, during which we barely move at all. Most dream states, and certainly those with the most vivid dreams, happen during REM sleep.

There's some evidence that other mammals may also dream. For example, researchers compared the brain patterns of rats running through a maze when awake with their brain patterns during REM sleep. They found the patterns were very similar and concluded that the sleeping rats were dreaming about going through the maze.

But finding evidence of dreaming in non-mammals has proved more difficult. Their brains are very different from those of humans, and it can often be difficult to record their activity while they are sleeping. Recently, however, researchers succeeded in recording brain activity in sleeping pigeons. As in mammals, the recordings revealed both REM and non-REM sleep. Intriguingly, REM sleep activity was high in brain regions involved in processing visual information, especially images related to physical activities such as flying, which suggests that this may possibly be what the pigeons were dreaming about.

That said, dreaming and REM sleep are unlikely to be universal in the animal kingdom. For example, sponges don't have brains, so they lack the machinery for dreaming. There are also some animals with unusual sleep patterns. These include whales and dolphins, which do not shut down their entire brain when they sleep, but only half of it, keeping the rest awake. They also show no sign of REM sleep, suggesting that they may only experience non-REM dreams, which are less vivid. This is surprising because we tend to think of whales and dolphins as having complex inner lives. It's thought that they don't experience REM sleep because during REM sleep animals are more vulnerable to extremes of temperature.

Nevertheless, in many cases REM sleep does seem to have benefits. Growing evidence from birds and mammals suggests that REM sleep and dreaming are important for forming memories and learning. It is believed that when events are replayed in dreams, this helps to integrate memories into longer-term storage. As soon as animals evolved moderately complex lifestyles, they would have needed to dream in order to manage these lifestyles.

However, we still don't understand how this outward behaviour relates to internal experience. It seems impossible to know what it is like to be a rat or a pigeon, let alone imagine their dreamscapes. We are quick to interpret the twitching limbs and quiet barks of sleeping dogs, but the truth is that we don't know if there is an internal experience of chasing rabbits that comes along with that.

Another non-human dreamer offers insight here. In 2019, while making a documentary, David Scheel of Alaska Pacific University in the USA housed an octopus named Heidi in a tank in his living room. At one point, in the middle of the night, Heidi seemed to dream: her limbs and head moved, and her skin rapidly changed colour, as though she was pursuing a crab.

Similarly, a report recently emerged of a sleeping octopus apparently having a nightmare. Costello, as the octopus was called, thrashed around, extended his mantle as if trying to make himself look bigger, and squirted ink as though he were being attacked by a predator. The nightmare study is intriguing, says Scheel, but is only based on one animal. He argues that as well as outward behaviour, brain imaging is needed to show that the octopuses are replaying sequences of activities from their waking lives in dreams.

The trouble is that we will never be able to experience any animal's dreams. That goes for other humans' dreams too. But we can try to imagine what these dreamscapes are like by meeting animals on their own terms. For example, vision is the dominant sense for many humans, and so our dreams are heavily visual too. Dogs primarily navigate the world using smell while spiders rely much more on vibrations.

It is likely that dreaming has served multiple purposes since the first complex animals evolved. And if this is the case, it is possible that better understanding of these purposes might shed light on the true purpose of our own dreams.

PART 1 — QUESTIONS

Part 1

Questions 1-5

Complete the table below.
Choose ONE WORD ONLY from the passage for each answer.

Research into sleep and dreaming		
	Research findings	Comment
Humans	- humans experience REM sleep and non-REM sleep - in REM sleep, the eyes and muscles move	
1 <u>1</u>	similar brain patterns were observed when active and sleeping	indicative of dreaming
Pigeons	when sleeping, pigeons displayed activity in parts of the brain that deal with 2 <u>2</u> input	may have been dreaming of flying
Whales and dolphins	- still have 3 <u>3</u> their brain awake when they sleep - don't experience REM sleep, as this could affect their	their dreams are probably not very 5 <u>5</u>

Questions 6-13

Do the following statements agree with the information given in Reading Passage 1?

In boxes **6-13** on your answer sheet, write

TRUE if the statement agrees with the information

FALSE if the statement contradicts the information

NOT GIVEN if there is no information on this

TRUE if the statement agrees with the information

FALSE if the statement contradicts the information

NOT GIVEN if there is no information on this

6 Dreaming about past experiences helps us to create lasting memories of them.

7 It is now possible to tell what type of dream a dog is having.

8 David Scheel's documentary was influential on other research into the sleeping patterns of octopuses.

9 While it was asleep, the octopus called Costello reacted as if it was hunting.

10 Scheel believes more research into octopuses' dreams should be carried out.

11 We may soon be able to share the dreams of other human beings.

12 Hearing may be an important part of the dreams of some animals.

13 Interest in the reasons why humans dream has increased greatly in recent times.

You should spend about 20 minutes on Questions 14–26, which are based on Reading Passage 2 below.

Mapungubwe

Located in southern Africa just below the Limpopo River, the kingdom of Mapungubwe, flourished between the 11th and 13th century CE

A Mapungubwe, which was one of the first states in southern Africa, was formed by Bantu-speaking peoples who were farmers. The area controlled by the rulers of Mapungubwe had at its heart a large sandstone plateau, which was easily defended due to its inaccessibility. As with other kingdoms in the region of southern Africa, cattle herding and other types of farming brought plenty of food and a surplus that could be traded for needed goods. Archaeology has revealed extensive layers of bones and manure, which indicate that from the 9th century CE there were large cattle herds, the traditional source of political power in southern African communities. The archaeological record for the 10th century shows a marked increase in the number of domesticated cattle in the area as well as cotton cultivation and weaving, as indicated by abundant finds of spindle whorls.

B The total population of Mapungubwe at its peak in the mid-13th century was around 5,000 people. The chief or king of Mapungubwe was likely the wealthiest individual in the society, and would have owned more cattle and precious materials than anyone else. The king and his advisers dwelt in a stone enclosure composed of stone walls and housing built on the highest level of the community's territory, a natural sandstone hill which is some 30 metres high and 100 metres in length. Occupation on the hill dates from the 11th century and the entire complex was surrounded by a wooden palisade*, as indicated by postholes made in the rock. The rest of the community lived in mud and thatch housing spread out below the hill, although there is one stone structure here. This settlement, known as Babandyanalo, covers around 5 hectares (12.3 acres) and predates the hilltop structures.

C The kings of Mapungubwe were buried at the top of the hill site in a demarcated area away from the dwellings, while other members of the community were buried at the surrounding valley level. A wooden staircase connected the two levels, the sockets for the steps being clearly visible in the sandstone cliff face. There were some grander residences dotted around the outskirts of Babandyanalo, and these probably belonged to male relatives of the king. There are many other smaller but still impressive sites across the Mapungubwe plateau, which are located anywhere from 15 to 100 kilometres from the major hill site. Containing stone residences and walls, they likely belonged to local chiefs who acted as servants to the king.

D The Mapungubwe plateau has a very high number of carnivore animal remains and ivory splinters, suggesting that the skins of these large animals and ivory elephant tusks were accumulated, probably for trade with coastal areas reached by the Limpopo River. The presence of glass beads, almost certainly from India, indicate there was trade of some sort with other states on the coast who, in turn, traded with merchants travelling from India by sea. Mapungubwe also benefitted from locally-sourced copper and the gold trade as it passed from the kingdom of Great Zimbabwe (12-15th century), situated to the north of Mapungubwe, to the coastal city of Kosala. It is likely that trade links led to a strengthening of political authority in order to control and even monopolise these lucrative interregional connections.

E Archaeological discoveries reveal that pottery was produced on a scale large enough to suggest the presence of professional potters, and is another indicator of the prosperity of Mapungubwe society. Archaeological finds include spherical vessels with short necks, beakers, and bowls, many of which have decorative stamps. There are also ceramic discs, and whistles. In addition, cattle, sheep, and goat figurines, and small figures of highly stylised humans with elongated bodies and short limbs have been found. The figures may have been used in ceremonies as offerings to ancestors, but their precise function is not known. Other discoveries include small jewellery items made from locally sourced copper.

F Beautifully decorated artefacts made of gold have also been found at Mapungubwe. A type of decoration, found nowhere else except Great Zimbabwe, involved the crafting of gold into small rectangular sheets and carving geometrical patterns into it. These sheets were then used to cover wooden objects (which have not survived) using small tacks, also made of gold. One such object that has been discovered may have been a sceptre, while additional evidence of local gold-working is a rhinoceros figurine made from small hammered sheets, and thousands of small gold beads. These objects were all found at the royal burial site and date to c. 1150. They are the first known indicators that gold had an intrinsic value of its own (as opposed to that of a currency) in southern Africa.

G The kingdom of Mapungubwe was already in decline by the late 13th century, probably because overpopulation placed too much stress on local resources, a situation that may have been brought to a crisis point by a series of droughts. Trade routes may also have shifted northwards. Certainly, the areas that now prospered were to the north, such as Great Zimbabwe.

* palisade: typically a row of closely placed, high vertical wooden or iron posts used as a means of defence

PART 2 — QUESTIONS

Part 2

Questions 14-19

Reading Passage 2 has seven paragraphs, A-G.

Which paragraph contains the following information?

14 a mention of the uncertainty regarding the purpose of certain objects

15 the likelihood that a climatic factor increased the problems Mapungubwe faced

16 a mention of the location where members of the king's family are thought to have lived

17 a reference to people who brought goods by ship

18 an estimate of the size to which the Mapungubwe community grew

19 a mention of agricultural produce being exchanged for other items

Questions 20-21

Choose TWO letters, A-E.

The archaeological record reveals information about gold and the kingdom of Mapungubwe. Which **TWO** pieces of information are mentioned by the writer?

- A** Not everyone in Mapungubwe used gold as a form of payment.
- B** Items of gold were placed close to where Mapungubwe kings were buried.
- C** The most valuable item discovered in Mapungubwe was a sceptre made of gold.
- D** The way gold was decorated in Mapungubwe was also practised in another kingdom.

E Working with gold was a respected occupation in the Mapungubwe community.

Questions 22-26

Complete the summary below.

Choose ONE WORD ONLY from the passage for each answer.

Archaeological discoveries

The Mapungubwe community's **22** _____ *22* _____ is indicated by the amount of professionally made pottery discovered at the site. Many of these objects, such as beakers and bowls, are highly decorated and have been marked with stamps. Other finds include round ceramic objects, **23** _____ *23* _____ and figures of various animals, as well as models of people with stretched **24** _____ *24* _____. It is possible that these had a role in ceremonies to honour **25** _____ *25* _____. In addition, pieces of **26** _____ *26* _____ made from a local metal have been found at the site.

You should spend about 20 minutes on Questions 27–40, which are based on Reading Passage 3 below.

Artificial Intelligence

In many countries in the West, hysteria about the future of artificial intelligence (AI) is everywhere. There seems to be no shortage of sensationalist news about how AI could cure diseases, accelerate human innovation and improve human creativity. Just looking at the media headlines, you might think that we are already living in a future where AI has infiltrated every aspect of society.

While it is undeniable that AI has opened up a wealth of promising opportunities, it has also led to the emergence of a mindset that can be best described as 'AI solutionism'. This is the philosophy that, given enough data, machine learning algorithms can solve all of humanity's problems. But, in fact, instead of supporting AI progress, this mindset actually jeopardises the value of machine intelligence by disregarding important AI safety principles and setting unrealistic expectations about what AI can really do for humanity.

In only a few years, AI solutionism has made its way from the technology evangelists' mouths in Silicon Valley in California to the minds of government officials and policymakers around the world. The pendulum has swung from the dystopian notion that AI will destroy humanity to the utopian belief that our algorithmic saviour is here.

We are now seeing governments pledge support to national AI initiatives and compete in a technological race to dominate the burgeoning machine-learning sector. While many politicians proclaim the transformative effects of the coming 'AI revolution', they fail to realise the complexity around deploying advanced machine learning systems in the real world.

One of the most promising varieties of AI technologies are neural networks. This form of machine learning is loosely modelled on the neuronal structure of the human brain, but on a much smaller scale. But what many politicians do not understand is that simply adding a neural network to a problem will not automatically mean that you'll find a solution. Similarly, adding a neural network to a system of government does not mean it will be instantaneously more inclusive or fair.

AI systems need a lot of data to function, but the public sector typically does not have the appropriate data infrastructure to support advanced machine learning. Most of the data remains stored in offline archives. The few digitised sources of data that exist tend to be buried in bureaucracy. More often than not, data is spread across different government departments that each require special permissions to be accessed. Above all, the public sector typically lacks the human talent with the right technological capabilities to fully reap the benefits of machine intelligence.

For these reasons, the sensationalism over AI has attracted many critics. Stuart Russell, a professor of computer science at the University of California, Berkeley, has long advocated a more sensible and realistic approach that focuses on simple everyday applications of AI instead of the hypothetical takeover by super-intelligent robots. Similarly, Rodney Brooks, professor of robotics at Massachusetts Institute of Technology, writes that 'almost all innovations in robotics and AI take far, far, longer to be really widely deployed than people in the field and outside the field imagine'.

One of the many difficulties in deploying machine learning systems is that AI is extremely susceptible to adversarial attacks. This means that a malicious AI can target another AI to make it behave in a certain way, such as forcing it to make wrong predictions. Many researchers have warned against the rolling out of AI without appropriate security standards and defence mechanisms. Still, AI security remains an often overlooked topic when machine learning systems are installed.

If we are to reap the benefits and minimise the potential harms of AI, we must start thinking about how machine learning can be meaningfully applied to specific areas of government, business and society. This means we need to have a discussion about AI ethics and the distrust that many people have towards machine learning.

Most importantly, we need to be aware of the limitations of AI and where people still need to take the lead. Instead of painting an unrealistic picture of the power of AI, it is important to take a step back and separate the actual technological capabilities of AI from fantasy.

The medical profession has also recognised the drawbacks to AI. The IBM Watson for Oncology programme was a piece of AI that was meant to help doctors treat cancer. Even though it was developed to deliver the best recommendations, human experts found it hard to trust the machine. As a result, the AI programme was abandoned in most hospitals where it was trialled.

Similar difficulties arose in the legal domain when algorithms were used in courts in the US to sentence criminals. An algorithm calculated risk assessment scores and advised judges on the sentencing. The system was found to amplify structural racial discrimination and was later abandoned.

There are some crucial lessons here for everyone aiming to boost investments in national AI programmes. These examples demonstrate that there is no AI solution for everything. Using AI simply for the sake of AI may not always be productive or useful, and not every issue is best addressed by applying machine intelligence to it. All solutions come with a cost and not everything that can be automated should be.

PART 3 — QUESTIONS

Part 3

Questions 27-29

Choose the correct letter, **A**, **B**, **C** or **D**.

27 What is the writer doing in the first paragraph?

- A** predicting the future impact of AI
- B** describing a public perception of AI
- C** outlining some possible benefits of AI
- D** highlighting the breadth of the influence of AI

28 When discussing AI solutionism in the second paragraph, the writer

- A** points out a risk involved.
- B** specifies its probable origins.
- C** mentions its chief supporters.
- D** weighs up some pros and cons.

29 In the fourth paragraph, the writer suggests that many politicians may

- A** have failed to appreciate the true potential of AI initiatives.
- B** have misunderstood the function of the machine-learning sector.
- C** be unaware of the challenges of implementing national AI initiatives.
- D** be too keen to enter the race to dominate the machine-learning sector.

Questions 30-35

- A. reliability
- B. funding
- C. skills
- D. prejudices
- E. computers
- F. equality
- G. framework
- H. confidentiality
- I. approval

Complete the summary using the list of words, A-I, below.

AI in government, medicine and the law

Neural networks are a promising area of AI technology for governments. However, many politicians overestimate their capabilities, believing that the mere addition of a neural network will produce solutions and promote **30**

Most public sector organisations have not set up the necessary **31** to manage the huge amount of data required to enable AI to function. Complex bureaucracy is another issue, as each person involved needs **32** to access the relevant data, which is often spread across different departments. But the main problem is that few public sector employees have the **33** to take full advantage of machine intelligence.

The medical profession experimented with an AI programme, but their experts had little faith in its **34**, and the programme was abandoned. US courts also abandoned the use of algorithms when it was found that these reflected and magnified the existing **35** within the legal profession.

Questions 36-39

Do the following statements agree with the claims of the writer in Reading Passage 3?

In boxes 36-39 on your answer sheet, write

- YES** if the statement agrees with the claims of the writer
NO if the statement contradicts the claims of the writer
NOT GIVEN if it is impossible to say what the writer thinks about this

YES	if the statement agrees with the claims of the writer
NO	if the statement contradicts the claims of the writer
NOT GIVEN	if it is impossible to say what the writer thinks about this

36 Stuart Russell's proposals regarding the use of AI are impractical.

37 Rodney Brooks' view has attracted unfair criticism from supporters of AI.

38 Nowadays, the need to protect AI systems is always taken into account when they are set up.

39 In order to benefit from AI and minimise the harms, we have to explore people's concerns about its use.

Choose the correct letter, **A**, **B**, **C** or **D**.

40 What would be a suitable subtitle for Reading Passage 3?

- A** How to make the most of what AI has to offer
- B** Why AI may not be the answer to our problems
- C** Why governments should not invest in AI systems
- D** How AI could improve the efficiency of the public sector

ANSWER KEY

Answer Key & Explanations

#	Correct Answer	Explanation
1	rats	Excerpt/Passage Explanation: The passage explains that when these animals sleep, their brains show the same activity as when they are running through a maze while awake, which suggests they are dreaming. Answer Explanation: The answer 'rats' refers to the specific small animals that scientists studied to see if they experience dreams. Reason For Correctness: The correct answer is derived from the second paragraph, which describes a study focusing on how certain animals behave while they sleep. Researchers looked at the brain activity of these animals both while they were active (running through a maze) and while they were in a specific stage of sleep. Because the brain patterns or signals were almost the same in both situations, the researchers decided that these animals were likely dreaming about their daytime activities. This matches the table's description of 'similar brain patterns' being 'indicative of dreaming.'
2	visual	Excerpt/Passage Explanation: The passage states that when pigeons sleep, the parts of their brain that handle what they see (visual information) are very active, especially parts related to seeing themselves fly. Answer Explanation: The answer refers to the sense of sight, or things that are seen with the eyes. Reason For Correctness: The correct answer is derived from the section of the text discussing researchers who recorded the brain activity of sleeping pigeons. The study found that during REM sleep, there was a lot of activity in the parts of the pigeon's brain that process 'visual information'. In the table, the word 'input' is used as a synonym for 'information'. This activity occurred in areas related to seeing things like flying, which led researchers to believe the birds were dreaming about that activity.
3	half	Excerpt/Passage Explanation: The passage explains that when whales and dolphins sleep, they do not turn off their whole brain; instead, they keep half of it awake. Answer Explanation: The answer 'half' means that 50% or one of two equal parts of the brain stays awake. Reason For Correctness: The correct answer is 'half' because the text explains that certain animals have a special way of sleeping. Instead of turning off their whole brain, they only

#	Correct Answer	Explanation
		rest one part while the other part stays active. The passage specifically uses the word 'half' to describe the portion of the brain that remains awake in whales and dolphins.
4	temperature	Excerpt/Passage Explanation: The passage states that scientists think whales and dolphins do not have REM sleep because it makes them more likely to be harmed by very hot or very cold conditions. Answer Explanation: The answer 'temperature' refers to how hot or cold it is in a certain place. Reason For Correctness: The correct answer is 'temperature' because the text explains the relationship between REM sleep and the environment. It mentions that whales and dolphins do not show signs of REM sleep. The reason given is that animals in this sleep stage are more 'vulnerable' (weak or easily hurt) by very high or very low temperatures. Therefore, they avoid this stage to stay safe in their environment.
5	vivid	Excerpt/Passage Explanation: The passage explains that since these sea creatures do not have a specific active type of sleep, their dreams are probably not as clear or strong. Answer Explanation: The answer 'vivid' describes a dream that is very clear, bright, and detailed, similar to being awake in real life. Reason For Correctness: The correct answer is derived from the section on aquatic mammals. The text explains that these animals do not experience a specific active stage of sleep. In other species, this active stage is responsible for the most detailed and lifelike dreams. Because whales and dolphins lack this stage, the author concludes that their dreams are not very clear or intense.
6	True	Excerpt/Passage Explanation: The passage explains that when events from our lives are shown again in our dreams (replayed), it helps the brain save those memories so they last for a long time (longer-term storage). Answer Explanation: The answer means that when we dream about things that happened before, it helps our brain keep those memories for a long time. Reason For Correctness: The correct answer is TRUE because the passage says that replaying events in dreams helps the brain put memories into a place where they can stay for a long time. This process is called 'longer-term storage.' This matches the idea of creating lasting memories from past experiences. Important words to notice are 'replayed,' which means showing an event again, and 'integrate,' which means to combine or add something into a system.
7	False	Excerpt/Passage Explanation: The passage says that although humans often guess why dogs move or make sounds while they sleep, we actually do not know if the dog is really seeing a dream about something like chasing a rabbit in its mind. Answer Explanation: The answer means that we currently do not have the ability to know what a dog is specifically dreaming about. Reason For Correctness: The correct answer is FALSE because the text explicitly states that we do not know if dogs have a mental experience that matches their physical movements during sleep. While people might guess or 'interpret' a dog's barks or leg movements as a specific activity like 'chasing rabbits,' the passage clarifies that 'the truth is that we don't know' if those actions actually relate to a specific dream content. This directly contradicts the idea that it is 'now possible' to tell what their dreams are.
8	Not Given	Excerpt/Passage Explanation: The passage confirms that David Scheel made a film (documentary) about an octopus, but it provides no information about whether this film changed or helped other scientific research.

#	Correct Answer	Explanation
		Answer Explanation: The answer is NOT GIVEN because the text does not say whether or not David Scheel's documentary had an effect on other studies. Reason For Correctness: The correct answer is NOT GIVEN because while the passage mentions that David Scheel made a documentary and observed an octopus named Heidi, it never states that his work influenced or inspired other research. The text mentions another study about an octopus named Costello, but it does not say that this second study happened because of the documentary. Since the passage is silent about the impact or influence of the documentary on other scientists, we cannot say if the statement is true or false.
9	False	Excerpt/Passage Explanation: The passage explains that Costello's movements and use of ink were signs that he felt he was in danger and being attacked by another animal, which is the opposite of hunting. Answer Explanation: The answer is FALSE because the statement says the octopus was acting like it was hunting, but the text tells a different story. Reason For Correctness: The correct answer is FALSE because the passage describes the behavior of the octopus named Costello as though he were having a 'nightmare'. Instead of acting like a hunter (an animal looking for food), he acted like he was being 'attacked' by a 'predator' (an animal that wants to eat him). He used defensive moves, such as squirting ink and making himself look larger, to protect himself rather than to catch prey.
10	True	Excerpt/Passage Explanation: The passage explains that David Scheel finds the research about the octopus interesting, but it is limited because it involved only one animal. He argues that scientists must use brain imaging to see if the animals are actually dreaming about things they do while they are awake. Answer Explanation: The answer TRUE means that the statement matches the information given in the text. Reason For Correctness: The correct answer is TRUE because the passage mentions David Scheel's opinion on a study about a sleeping octopus. He says the study is interesting but notes it only studied one animal. He states that brain imaging is 'needed' to prove that octopuses are replaying their daily lives in their dreams. By saying this type of study is needed, he is expressing his belief that more research should be done to confirm these findings.
11	False	Excerpt/Passage Explanation: The passage says it is not possible for us to know or feel the dreams of animals or other people. Answer Explanation: The answer means that we will not be able to see or feel the dreams of other people in the future. Reason For Correctness: The correct answer is FALSE because the text says it is impossible to experience someone else's dreams. The passage uses the word 'never', which means it will not happen at any time. This directly contradicts the question, which suggests we 'may soon' be able to share dreams. The text explains that this difficulty applies to both animals and other human beings.
12	Not Given	Excerpt/Passage Explanation: The passage lists different ways animals experience the world, such as through sight, smell, and sensing movements (vibrations), but it stays silent about the sense of hearing. Answer Explanation: The answer means that the text does not provide any information about whether animals can hear things in their dreams. Reason For Correctness: The correct answer is NOT GIVEN because, although the passage discusses several senses that animals might use during their dreams, sound is never mentioned. The text specifically highlights sight (vision) for humans, smell for dogs, and

#	Correct Answer	Explanation
		vibrations for spiders, but it does not confirm or deny if hearing is an important part of dreaming for any animal.
13	Not Given	Excerpt/Passage Explanation: The passage says that knowing the reasons for animal dreams might help us find the real reason why humans dream, but it does not mention if the level of interest in this topic has gone up or changed lately. Answer Explanation: The answer "NOT GIVEN" means that the article does not provide any information about whether people have become more interested in the reasons for human dreams lately or not. Reason For Correctness: The correct answer is "NOT GIVEN" because the passage focus is on animal dreaming rather than human interest in the topic. While the text mentions that understanding animal dreams could "shed light" on the purpose of human dreams, it never says that people are more interested in this now than they were in the past. It also lacks any words like "increased," "growing interest," or "more popular" that would refer to how many people care about this research in "recent times."
14	E	Excerpt/Passage Explanation: The passage explains that although these figures might have been used in rituals for relatives who died long ago, no one knows for sure what they were actually for. Answer Explanation: The answer is Paragraph E, which mentions that people are not sure what the purpose of some items was. Reason For Correctness: The correct answer is Paragraph E because it describes various figurines of animals and people found by archaeologists. It states that while these objects might have been used for ceremonies, their exact use remains a mystery. The word 'function' is a synonym for 'purpose,' and 'not known' indicates 'uncertainty.'
15	G	Excerpt/Passage Explanation: The passage explains that the kingdom was failing because it had too many people using up its resources. It then says that several droughts, or long times without rain, probably made this difficult situation even more serious. Answer Explanation: The answer is G because paragraph G explains that the kingdom of Mapungubwe became weaker partly because of bad weather conditions. Reason For Correctness: The correct answer is G because this paragraph describes the decline of the kingdom. It mentions that there were already problems because of too many people, but these problems were likely made worse by a 'series of droughts.' A drought (a long time with no rain) is a weather event or 'climatic factor.' The text suggests this weather made the situation reach a 'crisis point,' which means it increased the severity of the existing problems.
16	C	Excerpt/Passage Explanation: The passage states that several larger houses were spread around the outer edges of an area called Babandyanalo, and it is likely that the king's male family members lived in these houses. Answer Explanation: The answer is Paragraph C, which identifies the places where the king's relatives likely resided. Reason For Correctness: The correct answer is Paragraph C because it specifically mentions "male relatives of the king" and where their homes ("residences") were located. In English, "relatives" is a synonym for "family members," and "residences" refers to the "location where they lived."
17	D	Excerpt/Passage Explanation: The passage says that local people traded with 'merchants' (people who buy and sell items) who arrived from 'India by sea' (using ships on the water).

#	Correct Answer	Explanation
		Answer Explanation: The answer is paragraph D because it mentions sellers who traveled from India across the ocean. Reason For Correctness: The correct answer is D because paragraph D mentions 'merchants' who traveled by 'sea'. In English, traveling by sea means using a ship or boat to move from one place to another. These merchants brought items like glass beads from India to Africa.
18	B	Excerpt/Passage Explanation: The passage explains that when the kingdom was at its most important time, about 5,000 people lived there. Answer Explanation: The answer is Paragraph B because it includes a specific number representing how many people lived in Mapungubwe. Reason For Correctness: The correct answer is B because it provides a numerical estimate of the population. It mentions that at its 'peak' (the point when it was most successful or largest), the community consisted of 'around 5,000 people'. It also describes the physical size of the settlement (5 hectares), both of which indicate the scale to which the community grew.
19	A	Excerpt/Passage Explanation: The passage explains that raising animals and growing food gave the people a lot of food. Because they had extra, they were able to exchange it to get other things they needed. Answer Explanation: The answer A refers to the first paragraph of the passage, where the specific information about trading farm products can be found. Reason For Correctness: The correct answer is located in Paragraph A because it describes how the people of Mapungubwe raised animals (cattle herding) and grew crops (farming). They had more food than they needed, which is called a 'surplus.' This extra 'agricultural produce' was then swapped or 'traded' for things they did not have but 'needed.' The words 'cattle herding and other types of farming' and 'traded' directly match the idea of agricultural produce being exchanged.
20	B	Excerpt/Passage Explanation: The passage states that a special style of making gold patterns was used in both Great Zimbabwe and Mapungubwe. It also explains that several gold objects were discovered at the location where the royal family was buried. Answer Explanation: The answer identifies two facts about gold from the text: first, gold items were buried with the kings, and second, a specific way of decorating gold was shared with another kingdom named Great Zimbabwe. Reason For Correctness: The correct answer is found in paragraph F. First, it mentions that gold items like a rhinoceros figurine and gold beads were 'found at the royal burial site,' which confirms that gold was placed where the kings were buried. Second, the passage describes a specific 'type of decoration' found only in Mapungubwe and 'Great Zimbabwe,' which confirms that this way of decorating gold was practiced in another kingdom.
21	D	Excerpt/Passage Explanation: The passage states that a special style of making gold patterns was used in both Great Zimbabwe and Mapungubwe. It also explains that several gold objects were discovered at the location where the royal family was buried. Answer Explanation: The answer identifies two facts about gold from the text: first, gold items were buried with the kings, and second, a specific way of decorating gold was shared with another kingdom named Great Zimbabwe. Reason For Correctness: The correct answer is found in paragraph F. First, it mentions that gold items like a rhinoceros figurine and gold beads were 'found at the royal burial site,' which confirms that gold was placed where the kings were buried. Second, the passage describes a specific 'type of decoration' found only in Mapungubwe and 'Great

#	Correct Answer	Explanation
		Zimbabwe,' which confirms that this way of decorating gold was practiced in another kingdom.
22	prosperity	Excerpt/Passage Explanation: The passage states that the large amount of expert pottery discovered shows that the Mapungubwe people were doing very well and were quite wealthy. Answer Explanation: The answer "prosperity" means a state of being successful, usually by having enough money and resources to live well. Reason For Correctness: The correct answer is found in Paragraph E. The text explains that archaeologists found a very large amount of pottery. Because there was so much professional work, it is a sign (or "indicator") that the society was wealthy and successful. The summary asks for a word to describe what the pottery indicates about the community, which matches "prosperity" in the text.
23	whistles	Excerpt/Passage Explanation: The passage states that researchers discovered round clay pieces and whistles in the area. Answer Explanation: The answer 'whistles' refers to small objects that make a sound when you blow into them, which were found by experts studying the ancient city. Reason For Correctness: The correct answer is 'whistles' because the summary follows the list of items found during archaeological work described in paragraph E. The passage mentions 'ceramic discs' (which the summary calls 'round ceramic objects') and then mentions 'whistles' right before describing 'figurines' (the 'figures of various animals' mentioned in the summary). This sequence confirms that 'whistles' is the missing item in the list of artifacts.
24	bodies	Excerpt/Passage Explanation: The passage explains that archaeologists found many small statues. Some were animals like sheep and cows, and some were people. The statues of people had very long (elongated) bodies and short arms and legs (limbs). Answer Explanation: The answer "bodies" refers to the main physical part of the small statues of people that were long or pulled out. Reason For Correctness: The correct answer is "bodies" because the text mentions that archaeologists found small human figures. It describes these figures as having "elongated bodies," where "elongated" is a synonym for "stretched". Therefore, the part of the models that is stretched is the bodies.
25	ancestors	Excerpt/Passage Explanation: The passage explains that researchers found small statues of animals and humans. These objects might have been part of special events to give gifts to family members who lived long ago. Answer Explanation: The answer "ancestors" refers to the family members who lived a very long time ago, such as great-great-grandparents. Reason For Correctness: The correct answer is found in section E of the passage. This section describes various items found by archaeologists, including small statues (figurines) of animals and people. The text suggests that these objects might have played a role in special cultural events (ceremonies). It specifically mentions that they may have been used as gifts or "offerings" to show respect to family members from the past, which the text calls "ancestors."
26	jewellery jewelry	Excerpt/Passage Explanation: The passage states that researchers found small objects used for decoration (jewellery) that were made from a metal (copper) found in that specific region.

#	Correct Answer	Explanation
		Answer Explanation: The answer is jewellery (or jewelry in American English), which refers to items like rings, necklaces, or bracelets that people wear for decoration. Reason For Correctness: The correct answer is 'jewellery' because the summary points to things made from a 'local metal'. The passage mentions that archaeologists found 'small jewellery items' made from 'copper', and it specifies that this copper was 'locally sourced', meaning it came from the nearby area.
27	B	Excerpt/Passage Explanation: The passage explains that there is a lot of strong emotion and excitement about AI in many countries. It says that because of flashy news stories, people might believe that AI is already a part of everything we do and that it can easily fix complex problems like diseases. Answer Explanation: The answer B means that the writer is describing how ordinary people and the media currently think about and react to artificial intelligence (AI). Reason For Correctness: The correct answer is B because the first paragraph focuses on how AI is seen by the public through words like "hysteria" and "sensationalist news." These words describe emotions and a general mood—or "perception"—created by media headlines. The author points out that these stories make people think AI is already used everywhere and can solve all problems, which tells us how society views the technology rather than just providing facts about it.
28	A	Excerpt/Passage Explanation: The passage explains that thinking AI can solve everything is dangerous for the future of the technology. It says this attitude puts the value of AI at risk because it ignores safety rules and makes people believe AI is more powerful than it really is. Answer Explanation: The answer means that the writer warns us about a danger or a negative result of believing that AI can fix every human problem. Reason For Correctness: The correct answer is A because the writer explains that the approach called 'AI solutionism' is actually harmful. The writer points out that this way of thinking 'jeopardises' (which means to put in danger) the progress of technology. This is a clear mention of a risk because it shows that expecting too much from AI causes people to ignore 'safety principles' and creates a false idea of what the technology can actually achieve.
29	C	Excerpt/Passage Explanation: The passage explains that although politicians talk about how great AI will be, they do not understand the complicated problems involved in making AI systems work in everyday situations. Answer Explanation: The answer means that people in government (politicians) might not understand how difficult it is to actually start using AI programs across a country. Reason For Correctness: The correct answer is C because the author points out a specific gap in what politicians understand. While these leaders talk about the big changes AI will bring, the text says they "fail to realise" (which means to be unaware of) the "complexity" (which means the challenges or difficulties) of "deploying" (which means implementing or putting into use) these systems in real life. This directly matches the idea of being unaware of the challenges of implementation.
30	F. equality	Excerpt/Passage Explanation: The passage explains that just because a government uses special computer programs, it does not mean the government will become fair or include everyone right away. Answer Explanation: The answer is equality, which means treating everyone in the same way and making sure things are fair for all people. Reason For Correctness: The correct answer is F because the passage discusses how politicians have wrong ideas about what technology can do. They believe that using a

#	Correct Answer	Explanation
		computer system like a 'neural network' will quickly solve problems and make society better. The text specifically mentions that using this technology in government does not automatically make it 'more inclusive or fair.' In English, being inclusive and fair is the same as promoting equality. Therefore, the word 'equality' fits the summary perfectly.
31	G. framework	Excerpt/Passage Explanation: The passage explains that for AI to work, it needs many facts (data), but government offices usually do not have the correct computer systems (infrastructure) ready to handle that data. Answer Explanation: The answer G, 'framework', refers to a basic system or structure that supports how something works. Reason For Correctness: The correct answer is G because the passage states that the public sector (meaning government organizations) usually does not have the right 'data infrastructure'. In this context, 'infrastructure' refers to the technical systems and organized structures needed to store and use information. The word 'framework' is used in the summary as a synonym for 'infrastructure' to describe these necessary technical systems.
32	I. approval	Excerpt/Passage Explanation: The passage says that government information is kept in many different locations, and you must ask for a formal 'yes' (special permission or approval) from each office if you want to use it. Answer Explanation: The answer is 'approval,' which means getting official permission or a 'yes' from someone in charge before you are allowed to do something. Reason For Correctness: The correct answer is 'I' because the passage explains that government data is often hard to get because it is kept in many different offices. To see this data, a person must get 'special permissions.' In the list of choices, 'approval' is a synonym for 'permission.' Therefore, the summary uses 'approval' to describe the official agreement needed to access information kept in separate departments.
33	C. skills	Excerpt/Passage Explanation: The passage highlights that the biggest problem for government organizations is a lack of workers who have the advanced technical knowledge required to use AI systems successfully. Answer Explanation: The answer 'skills' refers to the technical knowledge and abilities that employees need to use AI technology effectively. Reason For Correctness: The correct answer is derived from the text's discussion on why the public sector struggles with AI. The passage points out that government departments often do not have people with the necessary 'human talent' and 'technological capabilities'. In the context of the summary, the word 'skills' acts as a synonym for these terms, explaining why it is difficult for these organizations to get the most out of machine intelligence.
34	A. reliability	Excerpt/Passage Explanation: The passage states that there was an AI program designed to help doctors with cancer patients, but the human experts did not believe it worked well enough to be trusted. Because of this lack of trust, hospitals stopped using the program. Answer Explanation: The answer 'reliability' refers to whether something can be trusted to behave in a consistent way and perform its job correctly without failing. Reason For Correctness: The correct answer is 'reliability' because the text explains that medical experts (doctors) did not feel they could 'trust' the recommendations given by the IBM Watson AI program. In English, having 'little faith' in something is a way of saying you do not find it 'reliable' or trustworthy. Because the doctors could not depend on the machine to be right, they stopped using it, which is why the program was 'abandoned'.
35	D. prejudices	Excerpt/Passage Explanation: The passage says that the computer program used in courts made unfair treatment based on race stronger, so they stopped using it.

#	Correct Answer	Explanation
		Answer Explanation: The answer 'D' refers to 'prejudices', which means unfair feelings or opinions against a group of people based on things like their race. Reason For Correctness: The correct answer is 'D' because the passage explains that a specific AI system used in US courts was eventually stopped because it made existing unfair treatment worse. In the text, it mentions that the system would 'amplify structural racial discrimination'. 'Prejudices' is a synonym for discrimination, and 'magnified' in the summary matches the word 'amplify' from the passage, showing that the AI increased these unfair patterns.
36	No	Excerpt/Passage Explanation: The passage shows that Stuart Russell wants people to focus on using AI for normal, everyday tasks. It describes his ideas as being smart and possible to achieve. Answer Explanation: The answer is NO because the statement says Stuart Russell's plans are difficult or impossible to use, but the writer actually thinks his plans are smart and can work in real life. Reason For Correctness: The correct answer is NO because the text describes Stuart Russell's suggestions as a 'sensible and realistic approach.' In English, 'sensible' means showing good judgment, and 'realistic' means something that can actually happen or be done. These words are the opposite of 'impractical,' which describes something that is not useful or cannot be done easily. Therefore, the writer disagrees with the idea that Russell's proposals are impractical.
37	Not Given	Excerpt/Passage Explanation: The passage explains Rodney Brooks' opinion that AI progress is slow, but it never mentions what other people think about his opinion or if they have attacked his ideas. Answer Explanation: The answer is NOT GIVEN because the text does not say how AI supporters feel about Rodney Brooks' ideas or if they have criticized him. Reason For Correctness: The correct answer is NOT GIVEN because while the passage mentions Rodney Brooks and summarizes his viewpoint, it provides no information regarding the reaction of other people to his work. The text explains that he believes AI development takes a long time, but it does not mention 'unfair criticism' or any feedback from 'supporters of AI'. Since this information is missing, we cannot determine if the statement is true or false.
38	No	Excerpt/Passage Explanation: The passage says that when new AI systems are put into use, people often forget to think about how to keep them safe and protected. Answer Explanation: The answer "NO" means that the writer disagrees with the statement. The writer says that people often forget to protect AI systems when they are being set up. Reason For Correctness: The correct answer is "NO" because the passage states that AI security is an 'often overlooked' topic. While the statement says that protection is 'always taken into account' (considered or thought about), the writer explains that when machine learning systems are 'installed' (put into place or set up), people frequently fail to focus on their security. This direct contradiction between 'always' and 'often overlooked' makes the statement false according to the text.
39	Yes	Excerpt/Passage Explanation: The passage states that if we want to gain the advantages of AI and lower its risks, we must talk about why people do not trust it and what the fair rules for using it should be. Answer Explanation: The answer 'YES' means the author believes that to get the most good out of AI and reduce its dangers, we must talk about why people are worried and what the right rules for using it should be.

#	Correct Answer	Explanation
		Reason For Correctness: The correct answer is 'YES' because the writer says that if we want to 'reap the benefits' (gain good things) and 'minimise the potential harms' (make bad things smaller), we must discuss 'AI ethics' and the 'distrust' that people have. Talking about ethics and distrust is the same as 'exploring people's concerns' as mentioned in the question.
40	B	Excerpt/Passage Explanation: The passage states clearly that AI cannot fix every problem. It explains that using AI just to use it isn't always helpful and that some problems are better solved without using machines. Answer Explanation: The answer suggests that the article should be titled to reflect that artificial intelligence (AI) is not always the best way to fix our issues. Reason For Correctness: The correct answer is B because the passage focuses on the limitations and problems with 'AI solutionism'—the idea that AI can solve every human problem. It mentions several reasons why AI might not work well, such as the lack of proper data infrastructure, security risks, and historical failures in medical and legal fields. The author warns about setting unrealistic expectations and suggests that we should not apply AI to every single problem just because we can. Keywords like 'limitations,' 'drawbacks,' and 'no AI solution for everything' point to this main theme.
