Test Instructions

General Rules

- The test contains three reading passages and 40 questions.
- Allow approximately 20 minutes for each passage.
- Read every instruction carefully before answering.
- Write answers in the spaces provided.
- Check spelling and word limits for completion tasks.
- Transfer and review all answers before the time ends.

Time Plan

01

Passage 1

Questions 1–13 — 20 minutes

02

Passage 2

Questions 14–26 — 20 minutes

03

Passage 3

Questions 27–40 — 20 minutes

Do not turn over until you are told to begin. Manage your time carefully — 20 minutes per passage is recommended.

You should spend about 20 minutes on Questions 1–13, which are based on Reading Passage 1 below.

The problems and benefits created by the spread of the water hyacinth in Kenya

Water hyacinth (*Eichhornia crassipes*), an aquatic plant native to South America, first appeared in countries in Africa in the early 1900s. Scientists there called it the 'world's worst aquatic weed', after it spread from the southernmost tip of Africa in the early 1900s and started obstructing major dams and rivers.

In east Africa the plant arrived with Belgian colonists in Rwanda, who liked the look of its glossy leaves and delicate purple flowers floating in their ponds. But by the 1980s, it had 'escaped' out of the country via the Kagera river and made its way downstream to Lake Victoria. There, with no natural predators and perfect temperature conditions, the plant began spreading in the open water, blocking fishing routes and providing a new habitat for disease-carrying mosquitoes.

For the women who smoke fish from the lake to sell it has meant declining income, as the boats that once brought the fish to shore by the hundreds struggle to navigate through the mass of plants. But water hyacinth isn't their only headache. In order to smoke the fish that they buy, they must gather huge quantities of firewood, sometimes walking as far as 10 km each way to collect enough to complete their work. And each day as they cook, they breathe in the thick, grey smoke. About three out of four families in Kenya depend on wood or charcoal to cook their daily meals, and the rate is even higher in rural areas, Kenya's latest demographic and health survey shows. Using solid fuels like these for cooking increases indoor pollution. The World Health Organization estimates that about 14,300 Kenyans die annually as a result of indoor air pollution - most of which is caused by cooking and heating sources.

Some years ago, on the shores of Lake Victoria, huge piles of water hyacinth that villagers had taken out of the water in an attempt to clear it were a common sight. But buried in those decaying waxy leaves was a renewable energy gold mine. It turns out the floating plant isn't just good at spreading - its foliage also contains a high ratio of carbon to nitrogen. It's a magic combination that has captivated researchers' imaginations since as early as the 1980s when, across the world, they began to explore its potential as a biofuel. Just about 4 kg of the dried plant would be enough to cater for a large family's daily energy needs, early research predicted.

In 2014, Nigerian academics announced they had got better yields of biofuel gas when they mixed the plant with chicken manure. A few years later, Kenyan scientists confirmed what their Nigerian peers and others had already found: manure worked to improve the process of converting the weed into gas.

In 2018, the technology came to a village on the shore of Lake Victoria, called Dunga. The project promised a two-for-one solution to the dual menaces of the water hyacinth and dependence on firewood. The community received a pair of donated biogas digesters - machines that would transform a mix of water hyacinth and cow dung into biogas for cooking.

The digesters work a bit like a stomach. The mixture goes in one end - think of it as a mouth - and over the next 20 to 30 days, it goes through a fermentation process and breaks down, giving off gas that comes out the other end. From there, the clean-burning gas is passed through pipes to the point of use, just like traditional domestic gas. In Dunga, the machines produce enough gas to serve about 60% of the village's population. It is used in domestic stoves and for other household tasks such as purifying water and incubating chicks.

The project is testing whether biogas can provide an effective alternative to firewood and charcoal in rural Kenyan communities. Results indicate that the programme seems to be working. The women who smoke the lake fish are already getting sick less often. Besides, they don't have to devote a lot of time every day to gathering firewood, which is a great relief. As a result, they're able to make more money for their families from other enterprises.

Kanyiva Muindi is an epidemiologist and air pollution research fellow at the African Population and Health Research Centre in Nairobi. She says families who switch to the smokeless cooking method could expect fewer respiratory diseases. Women, young girls and children are particularly vulnerable because they are the ones who cook in the kitchen or outside over fires.

How much better the biogas stoves will be for the community's health still needs more research, says Dominic Kahumbu Wanjihia, Biogas International's chief executive. But unless the price of the machines drops, it's pretty clear that most communities will never be able to afford any, since they sell for about \$750.

Kanyiva says affordability is a challenge worth addressing, given the huge health and environmental dangers posed by 'dirty' fuels such as wood, charcoal and kerosene. If biogas could become affordable on a large scale, she says it 'would be life-changing for millions on the African continent and beyond'.

PART 1 — QUESTIONS

Part 1

Questions 1-7

Do the following statements agree with the information given in Reading Passage 1?

TRUE	if the statement agrees with the information
FALSE	if the statement contradicts the information
NOT GIVEN	if there is no information on this

1 Water hyacinth was introduced as a decorative plant in east Africa.

2 Fishermen took some water hyacinth plants to Lake Victoria.

3 It is now difficult to force boats through the thick water hyacinth on Lake Victoria.

4 Chemicals produced by the water hyacinth plants are affecting the numbers of fish in Lake Victoria.

5 Cooking with charcoal has been proved to be even worse for people's health than cooking with wood.

6 People found it impossible to remove much water hyacinth from Lake Victoria.

7 Scientists started investigating the possibility of using water hyacinth to generate biogas in the last

century.

Questions 8-10

Complete the flow-chart below.

Choose NO MORE THAN TWO WORDS from the passage for each answer.

Generating biogas for domestic use in Dunga

First, place water hyacinth together with some **8** 8 into a digester

↓

Leave the mixture until the **9** 9 is completed

↓

Capture the gas emitted by the digester and use **10** 10 to transport it to individual homes

↓

Then use the gas for cooking as well as making water fit for human consumption

Questions 11-13

Complete the notes below.

Choose ONE WORD ONLY from the passage for each answer.

Cooking with biogas in Dunga

Benefits for the women in the village of cooking with biogas

- no need for them to spend so much **11** 11 collecting fuel
- they can focus on different tasks that bring in **12** 12
- they are less likely to experience certain diseases connected to burning wood

Drawbacks of changing to biogas

- the **13** 13 of the digesters is beyond the reach of most villages

You should spend about 20 minutes on Questions 14–26, which are based on Reading Passage 2 below.

How could multilingualism benefit India's poorest schoolchildren?

The crowded and bustling streets of Delhi teem with life. Stop to listen and, above the din of rickshaws and buses, you'll hear a multitude of languages, as more than 20 million people go about their daily lives. Many were born and raised here, and many millions more have recently made India's capital their home, having moved from surrounding neighbourhoods, cities and states or across the country, often in the hope of gaining better jobs and a better life. Some arrive speaking fluent Hindi, the dominant language in Delhi (and the official language of government), but many arrive speaking any number of India's 22 officially recognised languages, let alone the hundreds of regional languages in a country of more than 1.3 billion people.

A team of researchers led by Professor Ianthi Tsimpli of Cambridge University is currently working on a project collecting data on 1,000 primary-age children in Delhi and the cities of Hyderabad and Bihar. The overriding aim of the four-year project, called 'Multilingualism and Multiliteracy', is to find out why in a country where multilingualism is so common (more than 255 million people in India speak at least two languages, and nearly 90 million speak three or more languages), the many benefits of speaking more than one language, observed in schools in Europe for instance, do not apply to many of India's schoolchildren.

'Each year across India, 600,000 children are tested, and year after year over 50% of children in Standard 5 ten-year-olds cannot read a Standard 2 seven-year-olds task fluently, and just under 50% of them cannot solve a Standard 2 subtraction task,' says Tsimpli. She explains that low educational achievement can lead to many of these students dropping out of school - a problem disproportionately affecting female students.

Tsimpli and her colleagues are investigating whether these low learning outcomes could be caused by an Indian school system where the language that children are taught in often differs from the language used at home. The research project, which focuses on 8 to 11-year-old schoolchildren in rural and urban areas, collects data on whether the schoolchildren live in slum* or non-slum areas. Many of the children have moved from remote, rural areas to urban areas. They are so poor they have to live in slums and, as a result of migration, they may speak languages that are different from the regional language.

Having already tested 1,000 children, the researchers will now embark on retesting them. They intend to look not only at test results, but also at variables such as the standard of schooling, the environment and the teaching practices themselves. It's possible that one of the causes of low performance is the lack of pupil-centred teaching methods; in many Indian primary schools the teacher dominates and there is little room for independent learning.

Although the findings are at a preliminary stage, Tsimpli and her team have found that the medium of instruction used in schools, especially English, may hold back those children who have little familiarity with, or exposure to, the language before starting school and outside of school life. According to Tsimpli, most of the evidence from this and other projects shows that English instruction for children from low socio-economic areas might not be the best way for them to learn, at least in the first three years of primary education.

'What we would recommend for everyone, not just low socio-economic status children, would be to start learning in the language they feel comfortable learning in ... English can still be used, but perhaps not as the medium of instruction in primary schools. It could, for example, be one of the subjects that are being taught alongside other subjects. We are not

suggesting that English be withdrawn - that ship has sailed - but we perhaps have to think more about learner needs. There is perhaps too much uniformity in teaching and less tailoring to the children's language abilities and needs,' says Tsimpli.

While the preliminary results show there is no difference in general intelligence among boys and girls from slum areas versus those from urban poor backgrounds, an unanticipated finding has been that children from slum backgrounds do not seem to lag behind children from other urban poor backgrounds - and in some cases outperform them (e.g. in numeracy and literacy tasks). According to the researchers, this unexpected finding may be down to the life experiences of children growing up in slums. They are likely to mature faster and come into closer contact with the numeracy skills essential for day-to-day survival.

The project has already caught the attention of government ministers, who are keen to use the findings of the study to inform and adjust school policy in Delhi and the wider state. 'They are as keen as us to understand how the challenging context of deprivation can be attenuated when focusing on the languages children learn and use while at school. Our findings don't mean you're doomed if you're poor. It may be that these low learning outcomes are because of the way education is provided in India, with a huge focus on Hindi and English as the mediums of instruction, to the potential detriment of children unfamiliar with those languages,' explains Tsimpli.

'Language is central to the way knowledge is transferred - so the medium of instruction is obviously hugely influential. We hope to ... show that problem solving, numeracy and literacy can and do improve in children who are educated in a language of instruction they know. The trick may be to bridge school skills with life skills and make use of the richness of a child's life experience to help them learn in the most effective ways possible,' says Tsimpli.

* slum: a very densely populated area in which the infrastructure is incomplete and services inadequate or non-existent

PART 2 — QUESTIONS

Part 2

Questions 14-19

- A. basic outlook
- B. employment opportunities
- C. wealthy visitors
- D. distant country
- E. primary objective
- F. similar advantages
- G. thriving economy
- H. nearby district
- I. dense population
- J. new immigrants

Complete the summary using the list of words, A-J, below.

Multilingualism in Delhi

The city of Delhi has a **14** _____ and as you walk through its streets you hear people speaking a variety of languages. Some of them have spent their entire life in Delhi, while others are **15** _____. Whether they have come from a **16** _____ or have travelled from the other side of India, they have all come in search of things such as improved **17** _____.

A team of researchers led by Professor Ianthi Tsimpli of Cambridge University is collecting data on primary-age schoolchildren in Delhi and other Indian cities. The **18** _____ of the research is to

discover why multilingual Indian schoolchildren do not experience 19 to those that multilingual schoolchildren in Europe experience.

Questions 20-23

Do the following statements agree with the claims of the writer in Reading Passage 2?

YES	if the statement agrees with the claims of the writer
NO	if the statement contradicts the claims of the writer
NOT GIVEN	if it is impossible to say what the writer thinks about this

20 Ten-year-old Indian schoolchildren tend to perform better in literacy tests than in numeracy tests.

.....

21 Tsimpli had problems convincing some female students to take part in the study.

.....

22 Tsimpli and her team wanted to know if there is a connection between poor academic performance and being taught in an unfamiliar language.

.....

23 The researchers have decided against investigating the impact teaching methodology may have on learning outcomes.

.....

Questions 24-26

Choose the correct letter, A, B, C or D.

24 What point does the writer make about primary schools in India in the sixth paragraph?

- A Exposure to English outside of school is of limited benefit.
- B Children learn English more easily when they are well motivated.
- C Poor children may be disadvantaged further by being instructed in English.
- D There is little consistency across schools with regard to instruction in English.

25 What is Tsimpli suggesting when she uses the phrase 'that ship has sailed'?

- A The findings of the report may be of little help to some Indian schoolchildren.
- B Instruction in English could be better adapted to the needs of schoolchildren.
- C Schools have had limited success in teaching English as a separate subject.
- D It is too late to remove English completely as a language of instruction in schools.

26 In the eighth paragraph, what do we learn has surprised researchers?

- A Boys and girls from low socio-economic groups have similar general intelligence levels.
- B The age at which children move into a slum does not affect their academic performance.
- C Slum children and children from other urban poor backgrounds have similar life experiences.

- D** The literacy and numeracy skills of slum children are not lower than those of children from other urban poor backgrounds.

You should spend about 20 minutes on Questions 27–40, which are based on Reading Passage 3 below.

The Globemakers: The Curious Story of an Ancient Craft

A review of Peter Bellerby's book *The Globemakers*

In 2008, Peter Bellerby, who lived in London, wanted to give his father a model globe for his eightieth birthday. What seemed simple enough to start with triggered an almost obsessive, decade-long journey, marked by a series of obstacles that would have deterred anyone less determined. It ended with his establishing the world's only bespoke globemaking company.

The first surprise in *The Globemakers*, Bellerby's account of this impulsive enterprise, is that obtaining such a globe was not simply a matter of a quick online order and a repressed sigh at the shipping costs. After all, contrary to stubbornly held popular views of our ancestors' geographical ignorance, we have known that the world is spherical since at least the 6th century BCE. The ancient Greek philosopher Plato in his work *Phaedo* likened it to a leather ball, while the accolade of producing the first recorded globe goes to the ancient Greek philosopher Crates of Mallus, who is said to have made one in around 150 BCE. Surely, Bellerby reasoned, a good-quality globe wouldn't be difficult to find.

Nearly two millennia later, however, it seemed that the art of globemaking had been largely forgotten. Bellerby came across shoddy commercial versions designed for school classrooms and genuine antiques in auction houses that would have bust his budget. Even his trips to Morocco and India, where surely the knowledge of artisan cartographers* had been preserved, drew a blank.

Not one to be easily thwarted, Bellerby decided to make his own good-quality globe. In the process, almost everything that could possibly go wrong did so. Even the shape of the Earth posed a problem, as it is not quite a perfect sphere, but oblate (slightly flattened at the poles). Having decided to compromise and opt for two half-spherical pieces that could be fitted together, he was unable to discover anyone capable of casting moulds with sufficient accuracy to ensure that he would not be left with two half-spheres that were not quite the same circumference. Even after he eventually resolved this issue, extracting these from the moulds resulted in piles of cracked plaster of Paris** and clouds of choking dust in the workshop he had set up at the rear of his house.

This series of abortive experiments taught Bellerby a lot about the challenges of making globes, which he communicates here to the reader. Finding just the right way to prise the globes from the mould - a high-end air compressor finally did the trick - and locating the right paper and inks with which to make the gores (the sections of flat sheet mapping that are pasted onto the spherical globe) without the ink seeping out to create a mushy, unreadable mess took months and an alarming chunk out of his bank balance. Bellerby's frustration at the painstaking process of attaching the gores to the globe surface - after having found a glue with precisely the right adhesive qualities - is palpable. Right at the end of the process, he learnt that the paper had stretched slightly and so the final one overlapped the first by a centimetre (which may not seem a great deal, but when that represents 2 per cent of the Earth's diameter, it's equivalent to obliterating the Himalayas or wiping out Chile).

Bellerby's account of the technical challenges of globe production is interspersed with a series of interludes on great globemakers of the past and cartographic history in general. Purists might wish for more map-making details, but Bellerby clearly found a kindred spirit in Martin Behaim. He was the Nuremberg entrepreneur who in 1492 created the Erdapfel, the world's oldest surviving globe, beautifully finished by a workshop of painters and other craftsmen, only to

find that the explorer Christopher Columbus had stumbled upon the Americas the very same year, rendering his masterpiece instantly out of date. Something of Bellerby's unflinching ambition is reflected in the even more heroic efforts of the Italian cartographer Vincenzo Coronelli³⁸, who, in the seventeenth century, created two globes for Louis XIV of France. It took him twenty years to complete the monstrous pair, whose vast bulk - each with a diameter of around four metres - can still be admired in the National Library of France in Paris.

Although a celebration of the revival of an ancient craft, Bellerby's book is also a lament for the fading away of centuries-old traditions. When he embarked on his globemaking odyssey, he struggled to find artisans with the skills to make the right moulds for the globes or foundries that could shape the meridians (the metal frames which girdle globes) in just the right way. Although he finally located the right craftsmen, some simply dropping in, serendipitously, to his workshop (by now in more suitable premises than his back room), many of these have now retired or passed away.

Bellerby's father finally did receive his eightieth birthday present, albeit two years late. Bellerby went on to found a company which now turns out over six hundred globes a year for customers who can have their own tiny village marked or more unusual requests fulfilled. His book, beautifully illustrated with photographs of the various stages of his venture and a few illustrations of historic globes and maps, is hardly a blueprint for commercial success. But it is more than enough to stir up admiration for the craftsmanship of the great mapmakers of the past and the obsessive determination of a modern successor who revived their almost moribund art.

* cartographer: someone involved in the science or practice of drawing maps

** plaster of Paris: a quick-setting plaster consisting of a fine white powder that hardens when moistened and allowed to dry

PART 3 — QUESTIONS

Part 3

Questions 27-32

- A. educational use
- B. rare materials
- C. inferior makes
- D. product exchange market
- E. necessary skills
- F. international
- G. challenging task
- H. memorable object
- I. internet purchase
- J. numerous problems

Complete the summary using the list of words, A-J, below.

A birthday gift

Peter Bellerby's plan to give his father a globe for his birthday was an unexpectedly **27** _____
_____ for which he had to overcome **28** _____.

He soon learnt that a straightforward **29** _____ would not be possible. Some
30 _____ that had been intended for **31** _____
were available, as were some expensive antique globes, but these were beyond his budget. He even travelled to

places where people might still have the **32** _____, but Bellerby could not find what he wanted.

Questions 33-36

Do the following statements agree with the claims of the writer in Reading Passage 3?

YES	if the statement agrees with the claims of the writer
NO	if the statement contradicts the claims of the writer
NOT GIVEN	if it is impossible to say what the writer thinks about this

33 The assumption today that people in the past knew very little about geography is correct.

34 Plato was criticised for saying the world was shaped like a leather ball.

35 The globe made by Crates of Mallus was an accurate representation of the known world.

36 Bellerby assumed he would have few problems locating a well-made globe.

Questions 37-40

Choose the correct letter, A, B, C or D.

37 When Bellerby had to attach the gores to the globe surface,

- A** he decided it was best to work quickly.
- B** he became aware of an unexpected issue.
- C** he was worried about the quality of his materials.
- D** he nearly gave up the whole project.

38 The reviewer mentions other globe makers of the past because

- A** Bellerby was particularly inspired by them.
- B** their achievements are not widely known.
- C** Bellerby had something in common with each of them.
- D** their difficulties could have been avoided.

39 What point is made about Bellerby in the seventh paragraph?

- A** He had long working relationships with numerous craftsmen.
- B** He understands the lack of interest in traditional crafts.
- C** He appreciates the importance of careful planning.
- D** He regrets the loss of many globe-making skills.

40 What does the reviewer say about Bellerby's book in the final paragraph?

- A** It does not tell you how to create a profitable business.
- B** It overlooks some important mapmakers.
- C** It fails to discuss the future of globe-making.
- D** It does not give enough details about individual customers.

ANSWER KEY

Answer Key & Explanations

#	Correct Answer	Explanation
1	True	Excerpt/Passage Explanation: The passage explains that the plant came to East Africa because Belgian people living there enjoyed the way the plant's shiny leaves and pretty flowers looked in their water ponds. Answer Explanation: The answer confirms that people in East Africa first brought the water hyacinth plant there because they thought it looked beautiful. Reason For Correctness: The correct answer is TRUE because the passage explains that the plant was brought to East Africa by people who liked how it looked in their ponds. The text mentions they liked the "glossy leaves" and "delicate purple flowers," which means they used the plant for decoration. Key phrases like "liked the look" and "glossy leaves and delicate purple flowers" show that its arrival was due to its appearance as a decorative or ornamental plant.
2	False	Excerpt/Passage Explanation: The passage explains that the plant moved out of Rwanda by traveling along the Kagera river until it reached Lake Victoria. Answer Explanation: The answer means that the statement is not true because the text provides a different explanation for how the plant arrived at the lake. Reason For Correctness: The correct answer is FALSE because the passage explains that the water hyacinth arrived in Lake Victoria naturally by floating down a river. It says the plant 'escaped' from Rwanda and moved through the Kagera river. The text does not say that fishermen moved it; in fact, the plant actually caused many problems for the fishermen by blocking their paths. Therefore, the idea that fishermen brought the plant there is wrong.
3	True	Excerpt/Passage Explanation: The passage explains that boats carrying fish have a hard time traveling because there are too many plants in their way. Answer Explanation: The answer says that it is true that boats have a hard time moving through the thick plants in Lake Victoria. Reason For Correctness: The correct answer is 'TRUE' because the passage explicitly mentions that boats now find it difficult to move through the water. It uses the words 'struggle to navigate' to describe what the boats are doing, which means the same thing as

#	Correct Answer	Explanation
		'difficult to force through.' It also mentions a 'mass of plants,' which matches the idea of the water hyacinth being 'thick.' These challenges are happening in Lake Victoria, where the fishing routes have been blocked.
4	Not Given	Excerpt/Passage Explanation: The passage explains that the plant grows quickly and stops fishing boats from moving through the water. It also mentions that the plant provides a home for mosquitoes, but it says nothing about chemicals or the amount of fish in the lake. Answer Explanation: The answer is NOT GIVEN because the text does not say whether the water hyacinth produces chemicals that change the number of fish in the lake. Reason For Correctness: The correct answer is NOT GIVEN because the passage only mentions that the plant blocks "fishing routes" and makes it difficult for boats to bring fish to the shore. There is no mention of "chemicals" coming from the plant or how such things might influence the "numbers" or population of fish in Lake Victoria. Since the passage does not provide this specific information, we cannot confirm if the statement is true or false.
5	Not Given	Excerpt/Passage Explanation: The passage says that many people in Kenya use wood or charcoal for cooking and that these 'solid fuels' cause indoor air pollution. However, it does not say if one of them is worse for health than the other. Answer Explanation: The answer is NOT GIVEN because the text does not compare the health risks of using charcoal versus wood. Reason For Correctness: The correct answer is NOT GIVEN because while the passage identifies both wood and charcoal as 'solid fuels' that cause indoor pollution and health issues, it never states that one is more dangerous than the other. The text groups them together but does not provide a comparison to prove that charcoal is 'worse' for health.
6	False	Excerpt/Passage Explanation: The passage says that some time ago, you could often see very big piles of this plant on the land because the local people had pulled them out of the lake. Answer Explanation: The answer means the statement is wrong. People were actually able to take plenty of the plants out of the water. Reason For Correctness: The correct answer is FALSE because the passage says that people who lived near the lake pulled a lot of the plant out of the water. It mentions that "huge piles" of the weed were often seen on the shore, which shows that removing it was definitely possible and done in large amounts. The word "huge" is a synonym for a large quantity, which directly contradicts the idea that they could not remove "much."
7	True	Excerpt/Passage Explanation: The passage says that starting in the 1980s, people around the world began to check if the plant could be used as a source of energy. Answer Explanation: The answer is TRUE because researchers began studying how to turn the water hyacinth into fuel back in the 1980s. Reason For Correctness: The correct answer is TRUE because the passage mentions that the plant has interested researchers since the 1980s, which is a time within the last century (the 1900s). During that time, they started to 'explore its potential as a biofuel'. Key terms to look for are 'researchers' (which means scientists) and 'biofuel' (which is a general term for energy sources like biogas).
8	cow dung	Excerpt/Passage Explanation: The passage states that the people in the village were given machines that change a combination of the water hyacinth plant and cow waste into

#	Correct Answer	Explanation
		a type of gas for cooking. Answer Explanation: The answer "cow dung" refers to the waste or poop from cows that is mixed with the water plant to produce gas. Reason For Correctness: The correct answer is "cow dung" because the text describes a specific project in a village where they use machines to make fuel. According to the passage, these machines (called digesters) require a mixture of the water hyacinth plant and cow dung to create the gas used for cooking. Keywords like "mix" and "water hyacinth" help identify that cow dung is the other ingredient needed.
9	fermentation process fermentation	Excerpt/Passage Explanation: The passage explains that after the ingredients are put into the machine, they undergo a change called the fermentation process over a few weeks. This change is what produces the gas that people then use for cooking. Answer Explanation: The answer refers to the natural chemical change that takes place inside the machine to turn the mixture into gas. Reason For Correctness: The correct answer is chosen because the text explains the step-by-step way the biogas machine works. It says that once the mixture is inside, it stays there for 20 to 30 days to go through a 'fermentation process.' This natural 'process' causes the material to 'break down' and release gas. Therefore, the mixture must finish this step before the gas can be collected.
10	pipes	Excerpt/Passage Explanation: The passage states that the gas, which burns cleanly, is moved through tubes called pipes to reach the place where it is needed, just like the gas used in many other homes. Answer Explanation: The answer "pipes" refers to long, hollow tubes used to move things like gas, water, or oil from one area to another. Reason For Correctness: The correct answer is "pipes" because the text explains how the biogas is moved from the biogas machine (the digester) to the people's homes. The passage describes the process by saying the gas is 'passed through pipes to the point of use,' which matches the step in the flow-chart about using something to 'transport' the gas.
11	time	Excerpt/Passage Explanation: The passage explains that these women are happy because they no longer have to use up a lot of their day picking up wood to use for fire. Answer Explanation: The answer 'time' refers to the hours and minutes in a day that a person uses to complete a task. Reason For Correctness: The correct answer is found in the section describing the positive changes for women in Dunga. The text explains that because they use biogas now, they do not have to 'devote' (which means to spend) many hours every day 'gathering firewood' (which is a type of fuel). This saves them from the long walks they used to take to find wood.
12	money	Excerpt/Passage Explanation: The passage states that since the women save time, they can now do other kinds of work to earn more money to support their homes. Answer Explanation: The answer means coins or paper notes that people use to buy things or pay for what they need. Reason For Correctness: The correct answer is supported by the text which explains that because women no longer spend many hours looking for wood, they have time for 'other enterprises'. These other jobs or activities allow them to 'make more money' for their families. In the notes, 'different tasks' matches 'other enterprises', and 'bring in' matches 'make'.

#	Correct Answer	Explanation
13	price	Excerpt/Passage Explanation: The passage explains that unless the cost of the machinery becomes cheaper, most local villages will not have enough money to buy them because they are very expensive. Answer Explanation: The answer "price" refers to the amount of money someone must pay to buy the biogas machines. Reason For Correctness: The correct answer is "price" because the text identifies the high cost of the equipment as a major problem. It explains that because the machines cost \$750, most local communities cannot afford them. Keywords like "afford" and the specific dollar amount highlight that the cost or "price" is too high for regular people to pay.
14	I. dense population	Excerpt/Passage Explanation: The passage describes Delhi as a very busy and 'crowded' place where more than 20 million people live, which shows how many people are packed into the city. Answer Explanation: The answer 'I' means that Delhi is a place where many, many people live very close together in a small area. Reason For Correctness: The correct answer is 'I' because the passage describes Delhi's streets as 'crowded' and mentions that there are 'more than 20 million people' going about their daily lives. In English, when a place has a very high number of people living in it, we say it has a 'dense population.' Therefore, the description of a 'crowded' city with millions of residents matches this term.
15	J. new immigrants	Excerpt/Passage Explanation: The passage explains that while many people in Delhi have lived there since birth, millions of other people have moved to the city from different towns and states not long ago. Answer Explanation: The answer 'J' stands for 'new immigrants,' which refers to people who have just recently moved to live in Delhi from other places. Reason For Correctness: The correct answer is found in the first paragraph, which describes the people living in Delhi. The text says some people were born there, but millions of others have 'recently made India's capital their home.' In the summary, these people are called 'new immigrants' because they moved into the city from different areas to find jobs. The word 'immigrants' is used for people who move to a new place to stay, and the word 'new' matches the text saying they moved there 'recently.'
16	H. nearby district	Excerpt/Passage Explanation: The passage explains that millions of people in Delhi have moved there from places that were either close to the city (the surrounding areas) or from very far away across the whole country. Answer Explanation: The answer H (nearby district) refers to a local area or region that is located close to a main city. Reason For Correctness: The correct answer is H because the passage mentions that people move to Delhi from 'surrounding neighbourhoods, cities and states'. The word 'surrounding' is a synonym for 'nearby', indicating that these places are close to the capital. This matches the summary, which contrasts people arriving from a 'nearby district' with those who have traveled 'from the other side of India' (which the passage describes as coming from 'across the country').
17	B. employment opportunities	Excerpt/Passage Explanation: The passage states that many people move from nearby or far away places to India's capital city because they want to find better jobs and have a better quality of life.

#	Correct Answer	Explanation
		Answer Explanation: The answer means that people moving to Delhi are looking for more and better ways to work and earn money. Reason For Correctness: The correct answer is supported by the text's mention of why people move to Delhi from other parts of India. The passage explains that millions have relocated to the capital 'often in the hope of gaining better jobs and a better life.' In this context, 'better jobs' is a direct synonym for the phrase 'improved employment opportunities' found in choice B.
18	E. primary objective	Excerpt/Passage Explanation: The passage states that the main goal (overriding aim) of the research study is to find the reason why many Indian students don't see the same positive results from being multilingual that students in places like Europe experience. Answer Explanation: The answer E stands for 'primary objective', which refers to the main goal or most important purpose of a specific activity or project. Reason For Correctness: The correct answer is 'primary objective' because the summary asks for the goal of the researchers. The passage uses the phrase 'overriding aim' to describe exactly what the project is trying to do. In English, 'primary objective' and 'overriding aim' are synonyms; they both mean the most important thing someone wants to achieve. The goal mentioned in both the passage and the summary is to understand why Indian children do not get the same benefits from knowing several languages as children in Europe do.
19	F. similar advantages	Excerpt/Passage Explanation: The passage explains that researchers want to discover why the "many benefits" (good things) found in European schools for children who speak many languages are not showing up for children in India. Answer Explanation: The answer "similar advantages" refers to the positive things or benefits that students get when they are able to speak more than one language. Reason For Correctness: The correct answer is F because the passage mentions that being multilingual usually provides "many benefits" in schools, using Europe as an example. The research study is specifically looking for the reason why Indian students are not seeing these same good results or "similar advantages" that have already been seen in other parts of the world. In this context, "advantages" is a synonym for "benefits."
20	No	Excerpt/Passage Explanation: The passage shows that a larger number of ten-year-old students (more than 50%) fail at reading than the number of students (less than 50%) who fail at math. This means they are not better at reading. Answer Explanation: The answer 'NO' means that the claim in the statement is incorrect. Ten-year-old schoolchildren in India actually do slightly worse in literacy (reading) compared to numeracy (math), not better. Reason For Correctness: The correct answer is supported by specific statistics mentioned in the passage regarding students in Standard 5 (ten-year-olds). The text notes that "over 50%" of these children cannot complete a reading task (literacy), while "just under 50%" cannot complete a subtraction task (numeracy). This shows that more children fail the literacy task than the math task, meaning performance in literacy is not better than performance in numeracy. The use of "over 50%" versus "just under 50%" is the key comparison here.
21	Not Given	Excerpt/Passage Explanation: The passage says that many students quit school if they do not do well in their studies, and this happens to girls more than boys. It mentions female students in this context, but it does not tell us anything about whether they were willing or unwilling to take part in Professor Tsimpli's research.

#	Correct Answer	Explanation
		Answer Explanation: The answer is NOT GIVEN because the text does not say whether it was difficult for Tsimpli to get female students to join the research study or not. Reason For Correctness: The correct answer is NOT GIVEN because the passage only mentions female students to explain that they are more likely to stop going to school if they get bad grades. It also briefly mentions that there is no intelligence difference between boys and girls. However, the text never mentions the process of asking students to take part in the study, nor does it say that the researcher (Tsimpli) had any trouble persuading girls to participate. Since this information is missing entirely, the claim cannot be confirmed or denied.
22	Yes	Excerpt/Passage Explanation: The passage explains that the research group is trying to see if the reason children have a hard time learning is that schools use a language that is different from their home language. Answer Explanation: The answer YES means that the statement is true and matches the information given by the writer in the text. Reason For Correctness: The correct answer is YES because the passage says that researchers are looking into whether bad grades and low learning levels happen because the school language is not the same as the language the students speak at home. If the language used in the classroom is unfamiliar to the student, it might be the reason they struggle with schoolwork. Key words to notice are "investigating" (meaning checking or researching), "low learning outcomes" (meaning poor performance in subjects like reading or math), and "differs" (meaning it is different or unfamiliar).
23	No	Excerpt/Passage Explanation: The passage explains that the team of researchers plans to study more than just the scores from tests. They want to look at the quality of schools and the specific ways that teachers teach their students. Answer Explanation: The answer 'NO' means that the statement—claiming that researchers chose not to study how teaching methods affect learning—is the opposite of what is actually written in the text. Reason For Correctness: The correct answer is 'NO' because the researchers do plan to examine teaching methods. The passage mentions that while they are retesting the children, they want to look at 'variables' (things that can change) like 'teaching practices' and 'pupil-centred teaching methods.' Since the researchers 'intend' (plan) to study these things, the statement saying they 'decided against' (chose not to) do so is false.
24	C	Excerpt/Passage Explanation: The passage says that teaching in English is likely not the best choice for helping children from poor families learn when they first start school. Answer Explanation: The answer means that kids from poor backgrounds might face even more difficulties in school when their lessons are taught in English because they are not used to that language. Reason For Correctness: The correct answer is supported by the sixth paragraph, which discusses how the 'medium of instruction' (the language used for teaching) affects students. The text notes that using English can 'hold back' certain students. Specifically, it mentions that for children from 'low socio-economic areas'—a synonym for poor children—teaching in English is often not the most effective way for them to learn during their early years of school. This suggests that instead of helping them, English-led teaching creates a 'disadvantage' for these students.
25	D	Excerpt/Passage Explanation: The passage explains that the researcher does not intend to remove English from schools because it is no longer possible to do so. She believes the focus should instead be placed on understanding the needs of the children.

#	Correct Answer	Explanation
		Answer Explanation: The answer means it is already too late to stop using English as a teaching language in Indian schools because it is already a permanent part of the system. Reason For Correctness: The correct answer is D because Tsimpli explains that her team is not suggesting that English should be taken away or withdrawn from schools. By using the idiom 'that ship has sailed,' she communicates that the opportunity to completely remove English from the education system has already passed. Instead of trying to eliminate the language, she suggests that the education system should focus on better meeting the needs of the students and adapting how they are taught. Therefore, the phrase indicates that the current situation regarding English is now unchangeable.
26	D	Excerpt/Passage Explanation: The passage explains that researchers found something they didn't expect: children from very poor slum areas are not behind other poor city children in school skills. It even says that in some cases, these slum children do better in math and reading tests. Answer Explanation: The answer means that children living in slums (very poor, crowded areas) have reading, writing, and math skills that are equal to or even better than other poor children living in the city. Reason For Correctness: The correct answer is D because the eighth paragraph describes an 'unanticipated finding,' which means something the researchers did not expect to see. This surprising discovery was that slum children did not 'lag behind' (meaning they were not at a lower level than) other children from poor urban areas. In fact, they sometimes performed better in 'numeracy' (math) and 'literacy' (reading and writing) tasks. While the text also mentions that boys and girls have similar intelligence, it does not label that specific fact as a surprise, whereas the performance of slum children is explicitly called 'unanticipated.'
27	G. challenging task	Excerpt/Passage Explanation: The passage explains that even though Peter Bellerby thought his plan would be easy, it actually took ten years of hard work and many problems to complete, showing it was a very difficult task. Answer Explanation: The answer 'G' stands for 'challenging task'. Reason For Correctness: The correct answer is 'challenging task' because the passage describes Bellerby's project as something that 'seemed simple enough' at first but turned into a 'decade-long journey' (ten years) filled with 'obstacles' (problems) that required great 'determination'. This context shows that the plan was much more difficult and complex than he originally expected.
28	J. numerous problems	Excerpt/Passage Explanation: The passage explains that as Peter worked on making his globe, nearly every part of the project had something go wrong, showing how many difficulties he had to deal with. Answer Explanation: The answer 'numerous problems' means that Peter Bellerby faced a large number of difficult situations or setbacks while trying to achieve his goal. Reason For Correctness: The correct answer is 'numerous problems' because the passage highlights the many difficulties Peter encountered throughout his decade-long project. It mentions he faced a 'series of obstacles' and states that 'almost everything that could possibly go wrong did so.' These phrases describe a situation filled with many individual issues that required a lot of effort to solve, which matches the idea of having 'numerous problems.'
29	I. internet purchase	Excerpt/Passage Explanation: The passage explains that Bellerby was surprised to find that getting a globe was not something he could do easily by just buying one using the internet.

#	Correct Answer	Explanation
		Answer Explanation: The answer is 'I' (internet purchase). Reason For Correctness: The correct answer is internet purchase because the text explains that Peter Bellerby's attempt to get a globe was not as easy as making a 'quick online order'. In this context, an 'online order' is the same thing as an internet purchase. He found out that he could not just use the web to buy the high-quality globe he wanted, which is why the summary says 'a straightforward internet purchase would not be possible'. By comparing 'straightforward' with 'simply a matter of', we can see they are synonyms used to show that the task was more difficult than expected.
30	C. inferior makes	Excerpt/Passage Explanation: The passage states that Bellerby found globes that were made poorly (shoddy) and produced for selling (commercial versions) specifically to be used in school settings. Answer Explanation: The answer 'inferior makes' refers to products that are of poor quality or are not well-built. Reason For Correctness: The correct answer is 'inferior makes' because the text explains that Peter Bellerby was disappointed by the quality of the globes he could easily buy. The passage uses the phrase 'shoddy commercial versions' to describe these globes. The word 'shoddy' is another way to say 'inferior' (low quality), and 'commercial versions' refers to the different 'makes' or models of globes that were available for sale.
31	A. educational use	Excerpt/Passage Explanation: The passage explains that Bellerby found low-quality globes that were made specifically to be used by students in schools for learning. Answer Explanation: The answer "educational use" means that the globes Bellerby found were made for teaching students in schools. Reason For Correctness: The correct answer is "A" because the text says Bellerby found "shoddy commercial versions" of globes that were "designed for school classrooms". In this context, "school classrooms" is another way of saying "educational use". The word "shoddy" matches the idea of "inferior makes" mentioned in the summary.
32	E. necessary skills	Excerpt/Passage Explanation: The passage explains that Bellerby visited Morocco and India because he believed he would find craftspeople there who still knew how to make maps and globes by hand, but he was unsuccessful. Answer Explanation: The answer 'necessary skills' refers to the specialized expert knowledge and craftsmanship required to make high-quality globes. Reason For Correctness: The correct answer is E because the passage mentions Bellerby's travels to Morocco and India. He went to these specific locations hoping to find 'artisan cartographers'—people with specialized traditional expertise—who might have 'preserved' the specific knowledge needed to create globes properly. In the context of the summary, this 'knowledge' or 'craftsmanship' matches with the term 'necessary skills.'
33	No	Excerpt/Passage Explanation: The passage states that even though many people today strongly believe that people from the past were not knowledgeable about geography, humans have actually known that the Earth is round for thousands of years. Answer Explanation: The answer NO means the writer believes the statement is wrong. The writer argues that people in the past actually had a good understanding of the world's shape and geography. Reason For Correctness: The correct answer is NO because the author uses the phrase 'contrary to' to reject the idea that people from the past were uneducated about geography. While today's 'popular views' might suggest our ancestors lived in 'geographical ignorance', the author highlights that humans have known the Earth is 'spherical' (round

#	Correct Answer	Explanation
		like a ball) since at least the 6th century BCE. This directly contradicts the assumption that they knew very little.
34	Not Given	Excerpt/Passage Explanation: The passage mentions that Plato described the Earth as being like a leather ball in one of his writings, but it does not mention how other people felt about his idea. Answer Explanation: The answer is NOT GIVEN because the passage tells us what Plato said about the shape of the world, but it does not tell us if anyone reacted badly to it or disagreed with him. Reason For Correctness: The correct answer is NOT GIVEN because the text confirms that Plato compared the world to a 'leather ball,' but it provides no information regarding any criticism or negative feedback he may have received for this comparison. To choose 'YES' or 'NO,' the text would need to explicitly mention whether people agreed or disagreed with him. Since the passage is silent on the reaction to his words, the claim cannot be verified.
35	Not Given	Excerpt/Passage Explanation: The passage says that Crates of Mallus created the first ever recorded globe a long time ago, but it does not tell the reader if the globe was a good or correct map of the world. Answer Explanation: The answer is "NOT GIVEN" because the story does not tell us if the globe made by Crates of Mallus was correct or accurate. Reason For Correctness: The correct answer is "NOT GIVEN" because the passage identifies Crates of Mallus as the person who made the first recorded globe around 150 BCE. However, the text does not describe the quality of his work or whether it was an "accurate representation" of what people knew about the world at that time. Because the information regarding accuracy is missing, we cannot say if the statement is true (Yes) or false (No).
36	Yes	Excerpt/Passage Explanation: The passage says that Bellerby thought he could easily buy a globe that was made well. Answer Explanation: The answer means that Bellerby thought finding a high-quality globe to buy would be an easy task with no major issues. Reason For Correctness: The correct answer is YES because the text mentions that Bellerby believed a good globe would be easy to locate. He felt that since humanity has known the Earth is a sphere for centuries, a well-made model should be readily available. The phrase 'wouldn't be difficult to find' directly supports the idea that he expected 'few problems locating' one.
37	B	Excerpt/Passage Explanation: The passage explains that when Bellerby was finishing the work of sticking the map segments to the globe, he realized that the paper had become slightly longer than it should be, causing the map pieces to not line up correctly. Answer Explanation: The answer means that Bellerby found out about a new problem while he was putting the map pieces onto the globe. Reason For Correctness: The correct answer is B because the text explains that at the very end of the difficult process of sticking the map sections (called gores) onto the globe, Bellerby discovered a problem he didn't expect: the paper had stretched. This meant the last piece did not fit perfectly and instead overlapped the first piece. This fits the description of an 'unexpected issue.'

#	Correct Answer	Explanation
38	C	Excerpt/Passage Explanation: The passage uses the term 'kindred spirit' to show that Bellerby felt he was very similar to Martin Behaim. It also explains that Bellerby's 'ambition' (his desire to achieve a difficult goal) is also clearly seen in the work of Vincenzo Coronelli. These examples prove that Bellerby is like these historical globe makers. Answer Explanation: The answer means that the author of the review talks about historical globe makers to show how Peter Bellerby had many of the same qualities and went through similar experiences as they did. Reason For Correctness: The correct answer is C because the reviewer focuses on the similarities between Peter Bellerby and famous historical globe makers. In the passage, Martin Behaim is described as a 'kindred spirit,' which is a term used for someone who shares the same personality or feelings as another person. The reviewer also notes that Bellerby's 'unflinching ambition'—his strong determination to succeed even when faced with big problems—is 'reflected' or seen in the work of Vincenzo Coronelli. These comparisons demonstrate that Bellerby shared specific character traits with these past experts.
39	D	Excerpt/Passage Explanation: The passage says that while the book celebrates bringing an old job back to life, it is also a sad song for old traditions that are disappearing. This shows that Bellerby feels bad that these old skills are being lost over time. Answer Explanation: The answer means that Bellerby feels sad that many of the old traditions and special skills needed to make globes are disappearing because the people who knew how to do them are no longer around. Reason For Correctness: The correct answer is D because the passage describes Bellerby's book as a 'lament,' which is a way of expressing sadness or regret. He is sad that these 'centuries-old traditions' are 'fading away,' meaning they are slowly being lost. The text explains that when he started his project, he had a very hard time finding people with the necessary skills, and many of the experts he did eventually find have since retired or died, leading to a permanent loss of their craftsmanship.
40	A	Excerpt/Passage Explanation: The passage explains that while the book has many nice pictures and tells the story of Bellerby's work, it is not a guide for making a business successful or profitable. Answer Explanation: The answer means that the book written by Bellerby is not a set of instructions for building a business that makes a lot of money. Reason For Correctness: The correct answer is Choice A because the reviewer mentions that the book is 'hardly a blueprint for commercial success.' In this context, a 'blueprint' refers to a plan or a guide, and 'commercial success' refers to a profitable business. Therefore, the reviewer is saying the book does not provide a plan for starting a money-making company.
